

HYDRAULIC INSTALLATION KITS

Wherever there's a need to install a hydraulic hub look to Riverhawk to supply the answer. We've developed a hydraulic installation kit designed to meet your needs.

Our hydraulic installation kit has two pumps and their associated gauges mounted on a welded tubular steel sled with all the necessary fittings and flexible hoses needed for hub installation.

Our hoses have swivel fittings at each end with a Delrin inner liner, six layers of wound steel pressure support and a Nylon outer cover.

They can be readily flexed to a 10 inch radius for use of storage. The hoses are both rated for the higher pressure, thus are safely interchangeable.

All of the interconnecting fittings use the 60 degree angle cone connection which is the 'de facto' standard for high pressure equipment. These fittings are easier to connect than pipe threads and are much more leak resistant.

• Two Hydraulic Pumps and their gauges mounted on a welded steel sled providing an integral package.

- Flexible hoses, gauges and fittings for both high (35,000 psi) and low (10,000 psi) pressure connections.
- Hoses are safely interchangeable.
- System is pressure tested to full capability.
- Lightweight, about 45 lbs., easy to carry.
